

# EXECUTING PHASE

## *How to Get There*

### Chapter 7. Step 4: Iterate Toward the Target Condition

## TIME TO SHIFT GEARS

Having a next **target condition** (based on a grasp of the current condition and aimed at a challenge) is important, but **great execution** is equally important. If you have those two together then anything is possible.

This chapter of the Improvement Kata Handbook is about a highly-effective, scientific approach to execution. In this phase the Learner moves toward the target condition iteratively through experiments, while the Coach guides the process via daily Coaching Cycles with the Five Coaching Kata Questions.

It's in this phase that the pattern and logic of the Improvement Kata eventually becomes clear to the beginner Learner. The “why” we are working this way usually becomes apparent sometime during the frequent coaching cycles.

# Chapter 7

## The Improvement Kata - Executing Phase

### Step 4: ITERATE TOWARD THE TARGET CONDITION

**Practice  
this  
Routine**

# ORIENTATION

Understand  
the  
Direction

Grasp the  
Current  
Condition

Establish the  
Next Target  
Condition

Iterate Toward  
the Target  
Condition

The discovery  
process between  
Current Condition  
and Target Condition

Coaching  
Cycles

# LEARNER'S STORYBOARD

The Learner is now concentrating on this field

Focus Process:		Challenge:
<b>Target Condition</b> Achieve by: _____  <i>Learner may add detail to this field</i>	<b>Current Condition</b>  <i>Learner will now update this field regularly</i>	<b>PDCA Cycles Record</b>  
		<b>Obstacles Parking Lot</b>  <i>Learner will now update this field regularly</i>

# THIS CHAPTER GIVES YOU A STRUCTURED ROUTINE TO PRACTICE, THAT MAKES IT EASY TO CONDUCT EXPERIMENTS

# NOW THAT YOU HAVE A TARGET CONDITION, HOW DO YOU GET THERE?

# Most Important: ASSUME THE PATH IS UNCLEAR

Be open to solutions other than those you thought would get you there

We make plans and intend to execute them. But reality is neither linear nor predictable enough for this alone to be an effective means for achieving our target conditions.

With complex, dynamic systems we cannot plan or aim so well up front as to hit the target condition. Regardless of how well you planned, the path to achieving the target condition is somewhat of a grey zone.

**The Target Condition you established in the last step is a setup for experimenting at your Threshold of Knowledge. Progressing to the Target Condition now boils down to iterative ingenuity and receptiveness for adapting to new circumstances.**

# TIME TO PUT ON YOUR SCIENTIST HAT...

# ...AND WATCH FOR KNOWLEDGE THRESHOLDS

# WHAT'S THE *THRESHOLD OF KNOWLEDGE*?

It's the point at which you have no facts & data and start guessing

*There's always a knowledge threshold!*

# SCIENTIFIC THINKING MEANS LEARNING ALONG THE WAY TO THE TARGET CONDITION

Since the path to a challenging goal can't be predicted with exactness, we have to find that path by experimenting like a scientist. With each step and insight a scientist may adjust his or her thinking based on what has just been learned.

The scientific process can't tell us what's ahead. It only confirms or refutes the results of experiments.

A trick to making effective progress toward a challenging target condition is not to try to *decide* the way forward, but to *iterate* your way forward by experimenting as cheaply and rapidly as possible. This is the *action of innovation*.

What we may think  
*scientific thinking* is

Objective and certain:  
*"We have made the right plan"*

What *scientific*  
*thinking* really is

Always provisional:  
*"Our plan is a hypothesis"*

# WHAT SHOULD YOU DO AT THE THRESHOLD OF KNOWLEDGE?

- 1) **Acknowledge it.** (Difficult to do, until you get in the habit.)  
Key realization: There's always a threshold of knowledge.
- 2) **Stop and see further by conducting an experiment.** Don't deliberate over answers. Deliberate over the next experiment:  
*What do we need to learn next, how will we test that and how will we measure it?*

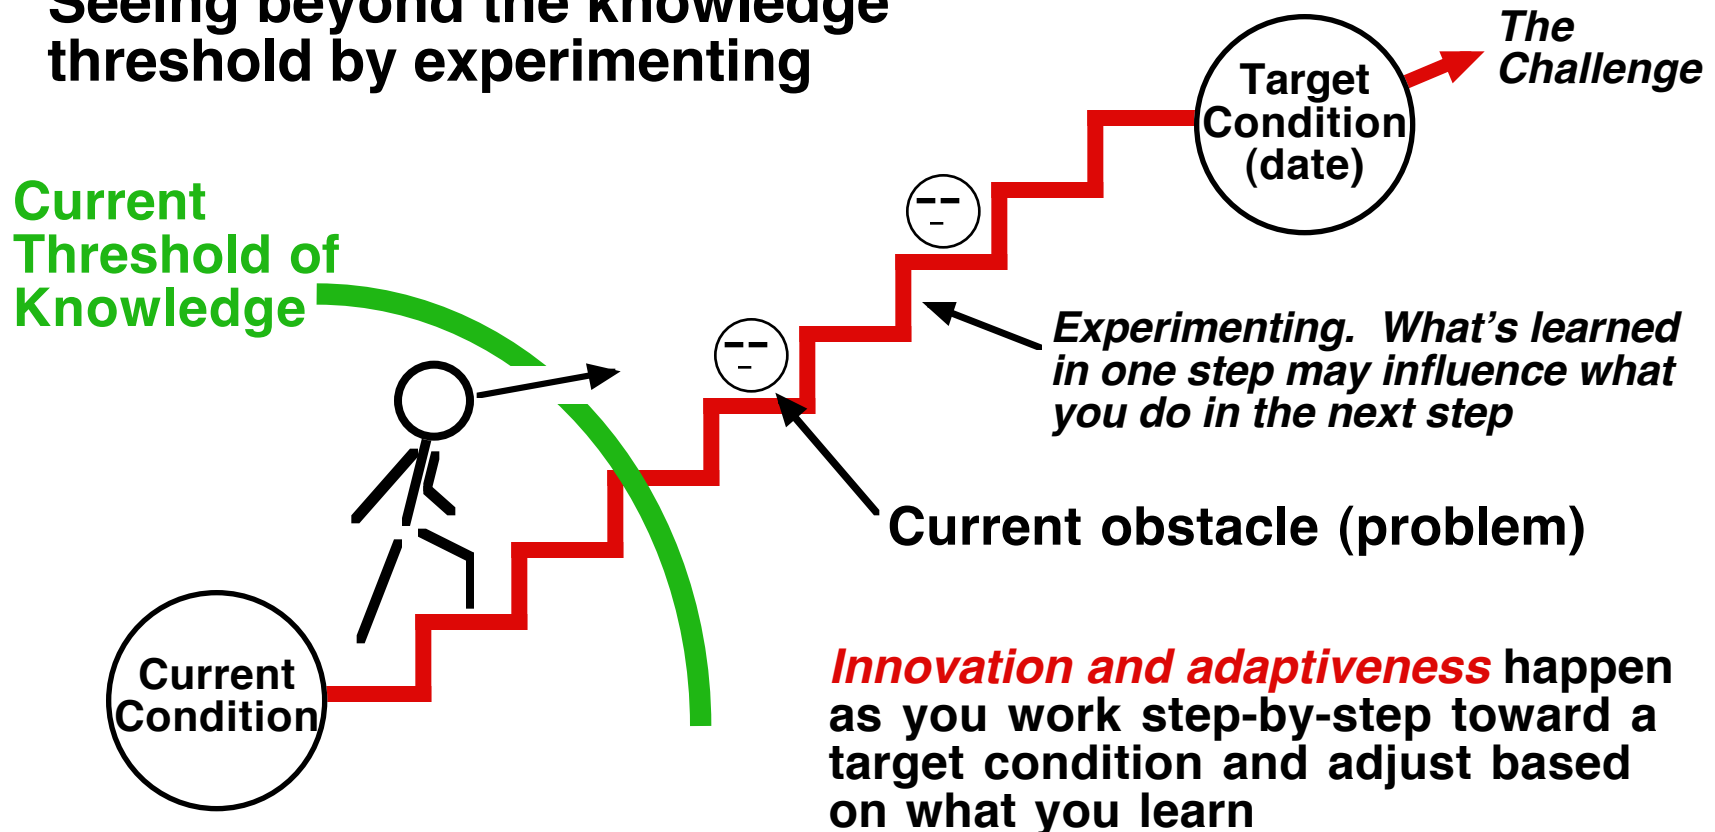

*The path can't be determined in  
advance through logic and debate*

# HOW TO WORK TOWARD THE TARGET CONDITION

**Step at a time, with learning and adjustments along the way**

With the Improvement Kata you learn as you strive to reach the Target Condition, and adapt based on what you're learning. Find the route to the Target Condition by learning from experiments and focusing on the next step based on that learning. This is how the adaptive "Learning Organization" becomes a reality.

**Seeing beyond the knowledge threshold by experimenting**

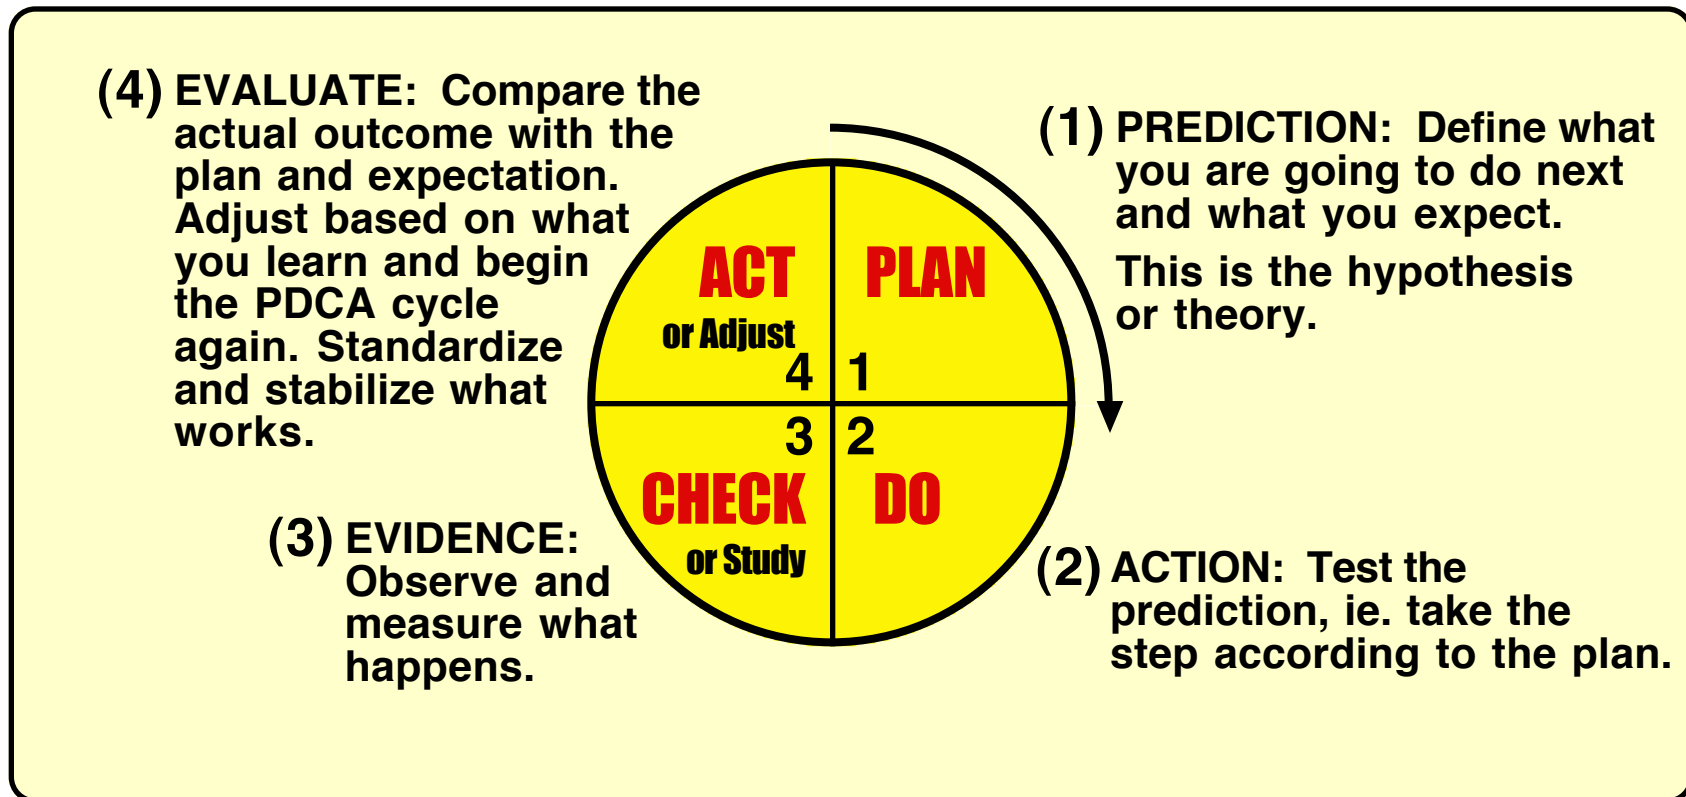

# THIS CYCLE OF ITERATION IS OFTEN CALLED:

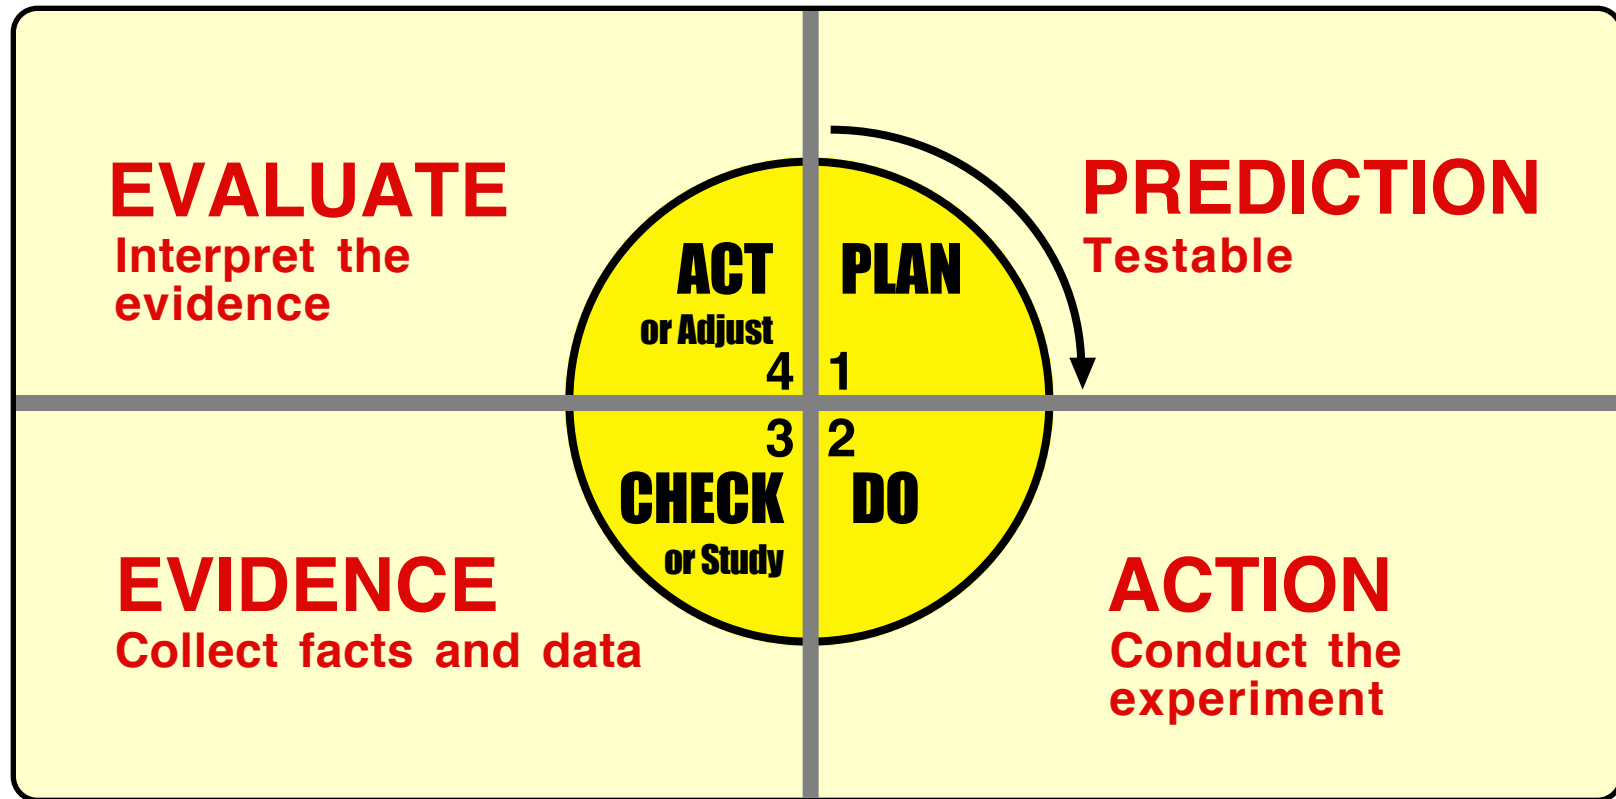

## “Plan-Do-Check-Act” (PDCA)

-- or --

## “Plan-Do-Study-Adjust” (PDSA)

# IT'S THE SCIENTIFIC LEARNING CYCLE

These steps comprise the scientific process of acquiring knowledge; by comparing a prediction with what actually happens. The PDCA cycle provides a practical means of attaining your target condition by giving you a systematic way of working through the grey zone.

**Let's take a closer look at how PDCA actually works...**

# THREE KEY POINTS ABOUT PDCA

# **PREDICTION ERROR, OR *SURPRISE* IS A BIG PART OF HOW PDCA HELPS YOU LEARN AND IMPROVE**

**Unexpected results (surprises) are very effective in driving learning. The Improvement Kata process seeks to use these lessons.**

**When a hypothesis is refuted this is in particular when you can gain new insight that helps you learn, improve, adapt and innovate. The purpose of PDCA is to generate surprises and thus opportunities for learning & progress toward the target condition.**

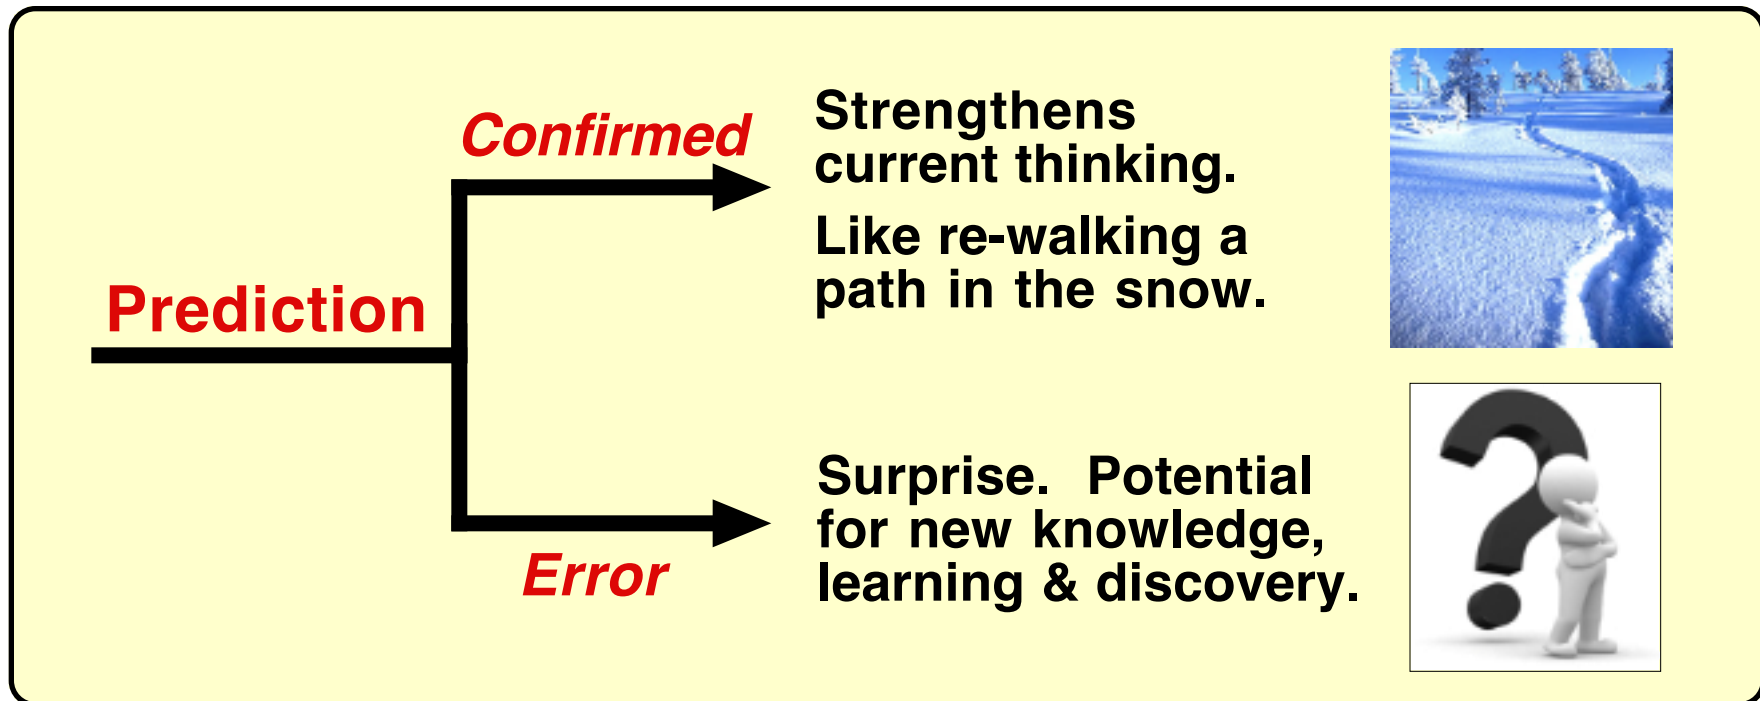

# THE PROCESS OF LEARNING

**Learning occurs when we compare what we expected to happen with what actually happens**

# HOW PREDICTION ERROR HELPS YOU PROGRESS TOWARD THE TARGET CONDITION

It's the scientific approach: When a result is as-predicted it confirms something you already thought. When a result is *different* than predicted you are about to learn something new.

Prediction **confirmation** keeps you in place. Prediction **error** leads you out of your assumptions and forces exploration.

*“If the result confirms the hypothesis, then you've made a measurement. If the result is contrary to the hypothesis, then you've made a discovery.” ~ Enrico Fermi*

# WE LEARN FROM REFUTED HYPOTHESES

The “P” of PDCA is an expectation or a prediction...  
...a *hypothesis*

The “C” of PDCA is a reflection...

*What are we learning from this?*

*What do we need to adjust?*

Illustration from *The Team Handbook*, page 3-33

A refuted hypothesis is useful because it impels you to challenge your beliefs, learn and adjust your approach. Unexpected results redirect your thinking, forcing new interpretations and steps. When you reflect and attempt to understand why your prediction was inaccurate you discover new insights and build new knowledge.

This is because a refuted hypotheses reveals a **knowledge threshold**. When something other than what you predicted happens -- when a plan, step, belief or hypothesis turns out to be incorrect -- it makes a knowledge threshold visible & puts you at the *learning edge*.

# YOU NEVER ACTUALLY KNOW WHAT THE RESULT OF A STEP WILL BE

**This is a key mindset to learn**

**A foundation of the Execution phase of the Improvement Kata is that whatever you think will happen with the next step is capable of being disconfirmed by evidence from taking that step. Without this capability there is little reason for conducting experiments.**

**Try to think of yourself as conducting experiments for the purpose of reconciling the new evidence you get from the experiment with what you were thinking when you planned the step. If you plan and take steps only to make something happen, rather than to test and potentially revise an idea, then your knowledge threshold won't change.**

**In an experiment you're primarily looking for facts and data that poke holes in your idea, not for confirmation of your idea. This may seem counterintuitive, but once you practice it will make sense and can be of great use.**

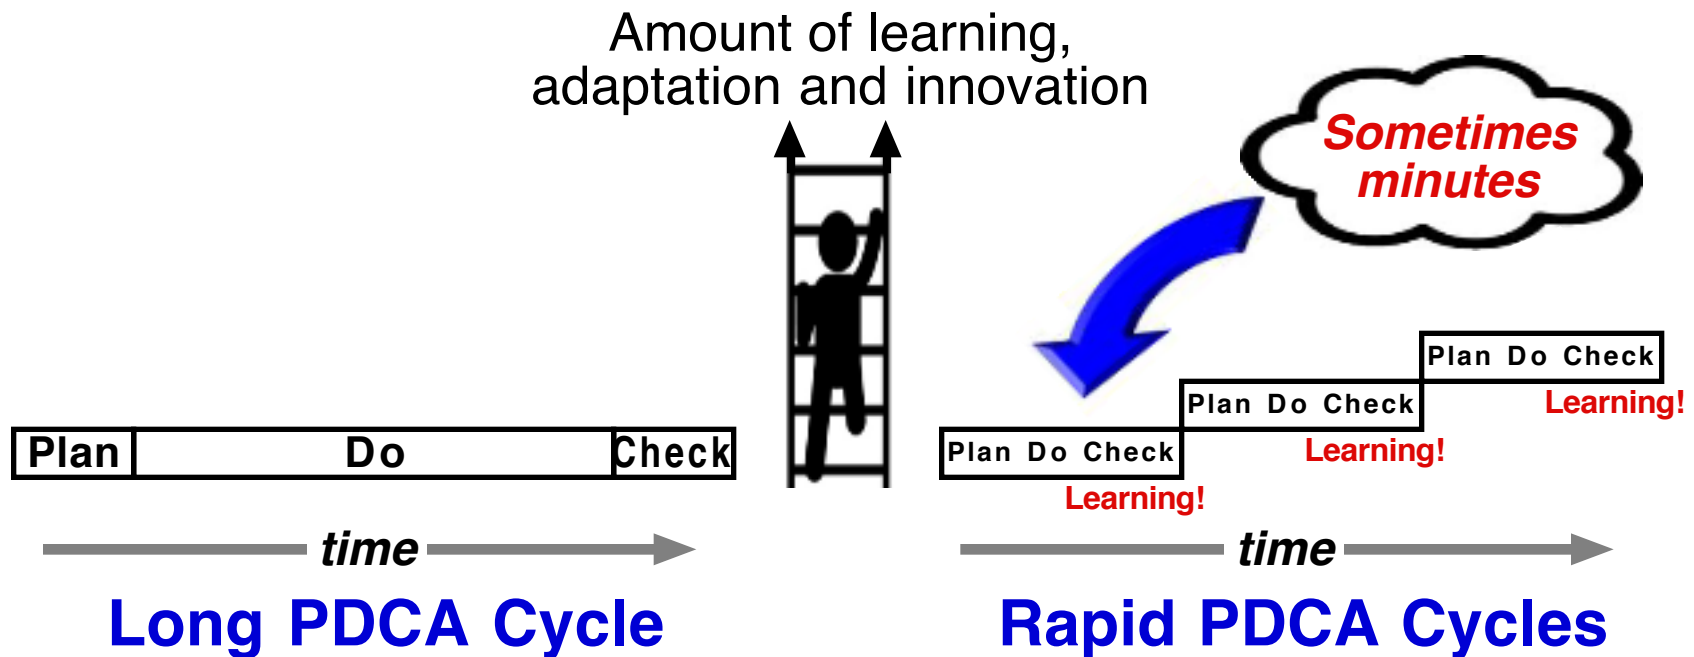

# RAPID & FREQUENT EXPERIMENTS = MORE, CHEAPER & SAFER LEARNING

**Learn early, learn often**

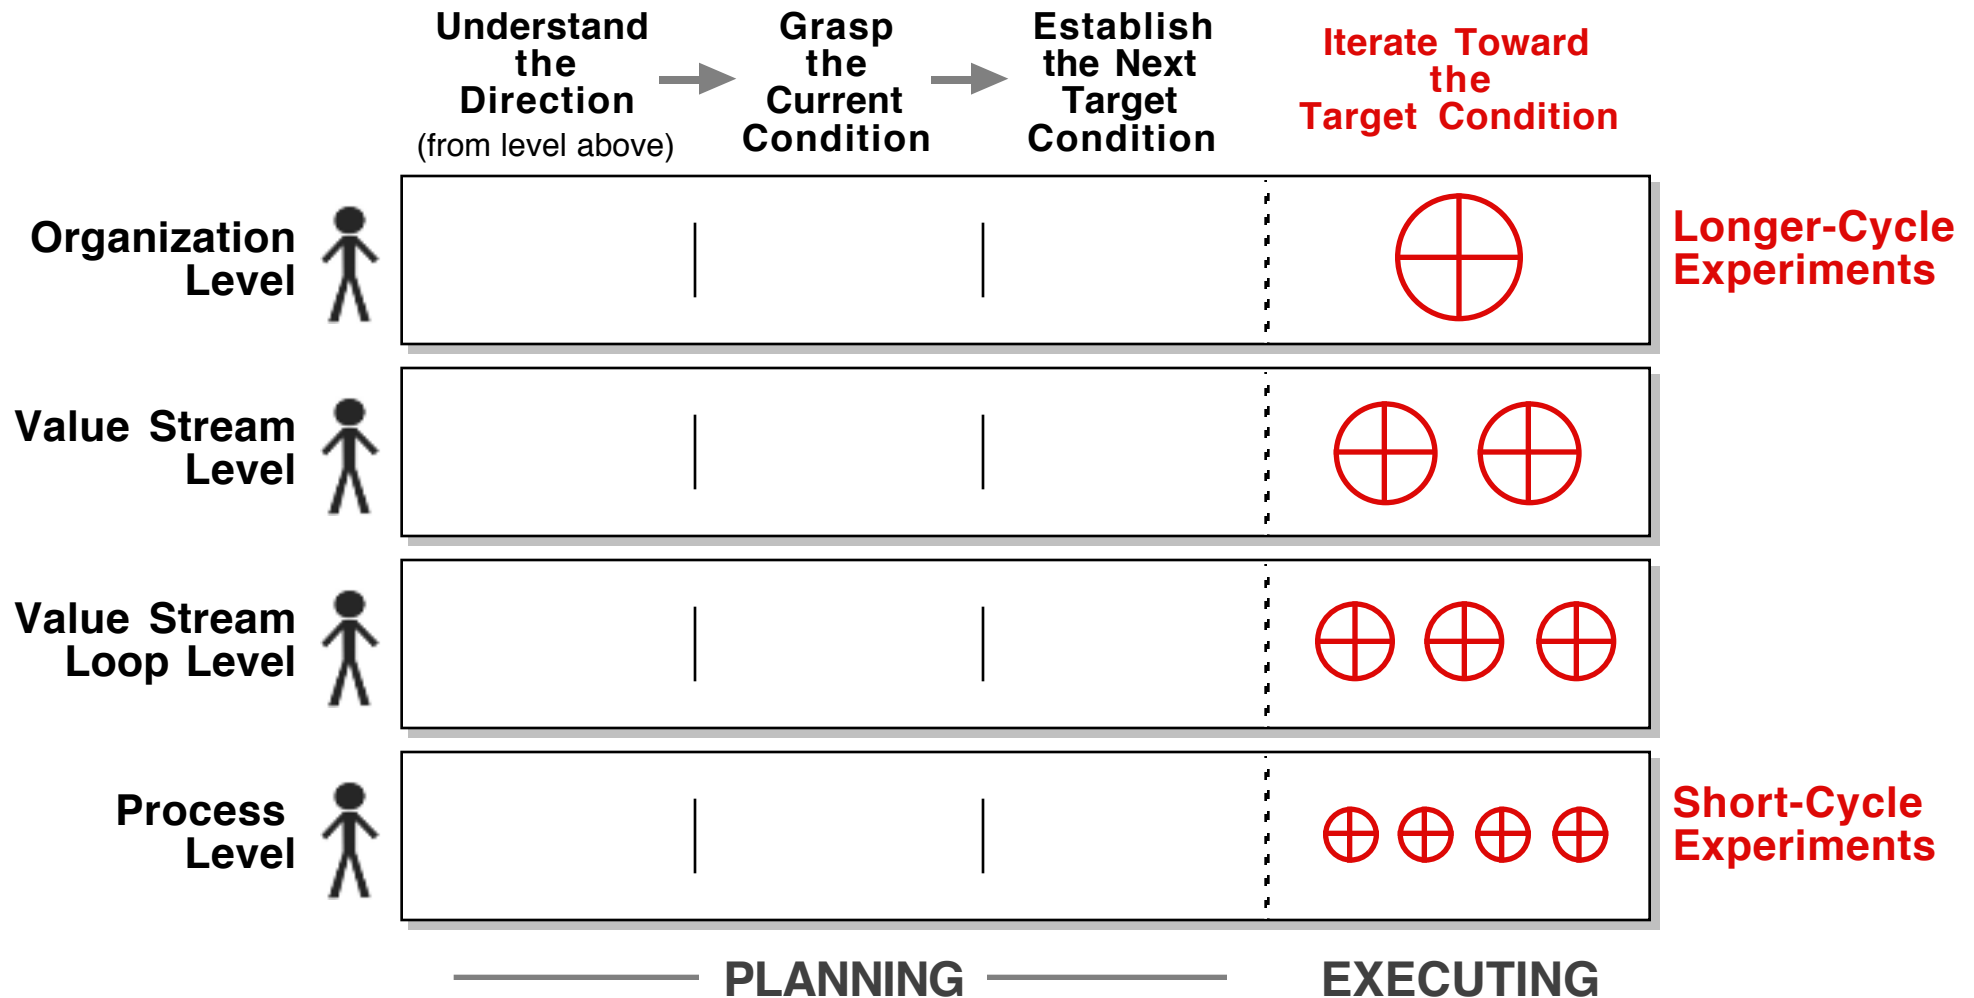

If prediction *error* is how we learn, then ideally we want those errors to happen as soon as possible. Some of the most useful learning comes from short and frequent PDCA cycles (daily experiments). The Improvement Kata is about testing and learning in as rapid and frequent cycles as possible.

**Long PDCA cycles don't produce enough timely learning to activate team ingenuity**

# AS RAPID & FREQUENT AS POSSIBLE

The faster you are able to learn, the more successful you'll be in reaching the target condition. But how rapidly you can experiment may vary depending on the level in the organization

# WHY RAPID & FREQUENT CYCLES?

PDCA is used at all levels of an organization. However, the learning that is most useful for improvement, adaptation and innovation often comes from experiments at the process level. Why?

--> At the process level you pick up useful detail. Checks at a higher, macro level alone may lead only to conjecture about why something happened -- rather than useful, detailed facts and data for adaptation -- because at this level there are often too many variables in play to discern cause & effect.

--> At the process level there is often enough time to adjust and still reach the target condition in time. Checks at higher levels of granularity may come too late to do much about it.

--> Small, process-level PDCA cycles are experiments that can be done on a scale where failures (learning) are inexpensive and don't harm the customer.

Learning at higher levels often comes from agglomerating (bundling) the findings of experiments at the process level.

## **EVERY STEP WILL NOT BRING A *MEASUREABLE* BENEFIT**

**You and members of your team may have a mindset that nearly every step taken should bring a measureable benefit. But that's an impossibly high bar that keeps you in the predictable zone.**

**This mindset will not allow your organization to really improve, adapt, innovate and beat the competition.**

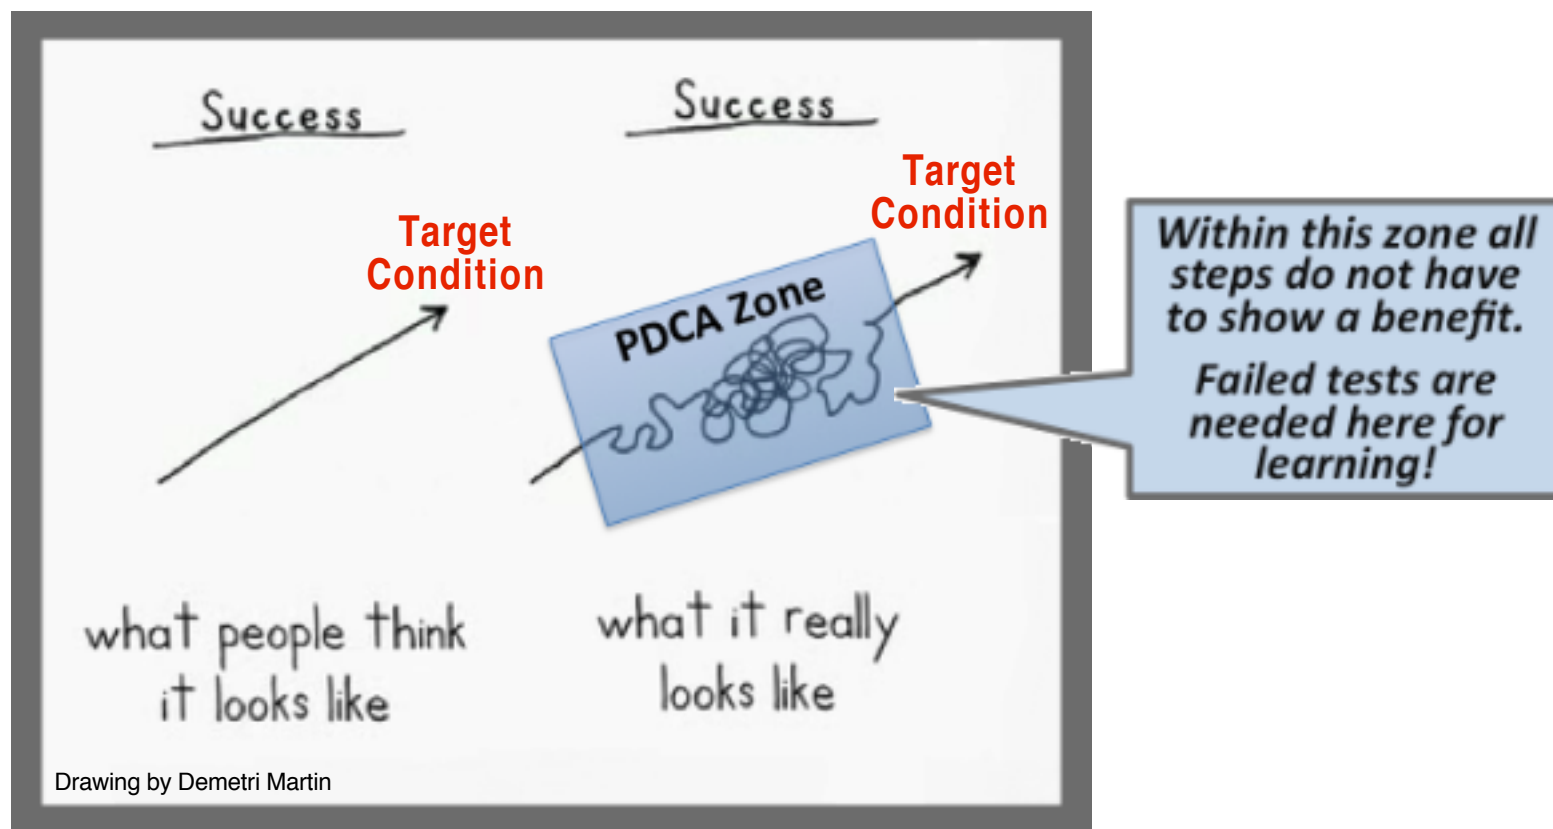

**It's the Target Condition, which has an achieve-by date and is measureable, that brings the benefit. The steps you take are the effort to get there.**

# THE PATH TO THE TARGET CONDITION WILL NOT BE A STRAIGHT LINE

The PDCA procedure is specified, but the path is not. Things will occur along the way that shift your thinking and cause you to revise your ideas. That's normal. The target condition remains the same, but the path shifts as you learn.

Failed predictions along the way are useful discoveries that show you what you need to focus on to achieve the target condition by the achieve-by date, and lead you to the next step. With each experiment the Learner learns a little more about what s/he needs to do to reach the target condition.

There must be room to make small errors and learn things along the way

**In Summary:**

**SMALL, RAPID EXPERIMENTS  
ADVANCE YOUR KNOWLEDGE QUICKLY**

# How to Practice

# USE THESE TWO ROUTINES TO TEACH AND FOSTER SYSTEMATIC, SCIENTIFIC ITERATION

**COACHING KATA**

### The Five Questions

- 1) What is the Target Condition?
- 2) What is the Actual Condition now?  
-----Turn Card Over!----->
- 3) What Obstacles do you think are preventing you from reaching the target condition?  
Which "one" are you addressing now?
- 4) What is your Next Step? (next PDCA / experiment) What do you expect?
- 5) When can we go and see what we Have Learned from taking that step?

\*You'll often work on the same obstacle for several PDCA cycles.

PDCA CYCLES RECORD (pick one most important)			
Obstacle:		Process:	
		Learned:	Coach:
Date, step & notes:	What do you expect?	What happened:	What we learned:

*Do a Coaching Cycle Conduct the Experiment*

The **Five Coaching Kata Questions** echo the scientific process. How to use them is described in the next part of this Handbook.

The **PDCA Cycles Record** is a tool for conducting series of experiments against obstacles, one obstacle at a time. How to use it is described in this chapter.

# TWO TOOLS & POWERFUL ROUTINES FOR ACHIEVING ANY TARGET CONDITION

The **Learner** uses this tool while conducting experiments against obstacles.

PDCA CYCLES RECORD (Start on a new experiment!)			
Obstacles:		Process:	
		Learner:	Coach:
Time, step & notes:	What do you suspect?	What happened?	What we learned

Used by the Learner

Target Condition

Current Condition

COACHING KATA	
The Five Questions	
1) What is the Target Condition?	
2) What is the Current Condition now?	
----- (Turn Card Over) -----	
3) What Obstacles do you think are preventing you from reaching the target condition?	
----- (Turn Card Over) -----	
4) What is your Next PDCA / experiment? What do you expect?	
5) When can we go and see what we Have Learned from taking that step?	
*You'll often work on the same obstacle for several PDCA cycles.	

Used by the Coach

The **Coach** asks the 5 Questions in a coaching cycle dialog, before each step (experiment) the Learner takes.

Forms available in the Appendix & on the Toyota Kata Website

# THE LEARNER'S PDCA ROUTINE STEP-BY-STEP

Plan and reflect on each of your steps (experiments) by using the PDCA CYCLES RECORD as explained on the following pages

# FIRST, PICK THE OBSTACLE

Do your experiments against one obstacle. You are free to select whatever obstacle you want. You don't need to start with the biggest obstacle. In fact, for Improvement Kata beginners it's often better to not tackle the biggest obstacle right away.

It doesn't matter where you start because once you get going then you're locked into the chain of PDCA cycles. All the obstacles that you will need to work on will wait patiently until you hit them. Your first step is free.

Use an arrow on the Obstacles Parking Lot to indicate visually what obstacle is currently being experimented against, and record this obstacle in the space provided on the PDCA Cycles Record.

Obstacle Parking Lot	
Obstacle	How can you measure that?
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____
• _____	_____

**Indicate what obstacle you are working on and also write it in the space on the PDCA Cycles Record**

# THE LEARNER'S PDCA CYCLES RECORD

PDCA CYCLES RECORD <i>(Each row = one experiment)</i>					
Obstacle:		Process:			
		Learner:		Coach:	
Date, step & metric	What do you expect?	<div>Do a Coaching Cycle</div> <div>Conduct the Experiment</div>		What happened	What we learned

# LAYOUT OF THE PDCA CYCLES RECORD

One obstacle per form\*

Each row = one experiment against the current obstacle

*This is the obstacle to the target condition, that you are currently working on.*

*\* Whenever the Learner starts working on a new obstacle, s/he should start a new PDCA Cycles Record*

PDCA CYCLES RECORD (Each row = one experiment)				
Obstacle:		Process:		
		Learner:		Coach:
Date, step & metric :	What do you expect?		What happened	What we learned
Last Experiment				
Next Experiment				
		Do a	Con	

**It usually takes a series of experiments in order to overcome an obstacle**

# LAYOUT OF THE PDCA CYCLES RECORD

The *prediction side* and the *evidence side*

PDCA CYCLES RECORD <small>(Each row = one experiment)</small>					
Obstacle:		Process:			
		Learner:	Coach:		
Date, step & metric :	What do you expect?	What happened :	What we learned		
<div style="border: 2px solid gray; border-radius: 15px; padding: 10px; text-align: center;"> <h2>Prediction Side</h2> <p>Written before the experiment</p> </div>		<div style="border: 2px solid red; border-radius: 15px; padding: 10px; text-align: center;"> <h2>Evidence Side</h2> <p>Recorded after the experiment</p> </div>			

Do a Coaching Cycle  
Conduct the Experiment

The prediction side (LEFT) is where you plan the next experiment and predict the outcome

The evidence side (RIGHT) is where you record what actually happened, compare that with the prediction and record what you learned

# CALIBRATE YOURSELVES BEFORE EXPERIMENTING

--- Ask your team: “*Why do we experiment?*” ---

It's not: *Let's see if this idea works*

But rather:

*Let's see what doesn't work, so we can see what we need to do to make it work*

This is what many of us mistakenly think *experimenting* is about

## **GOOD THINGS TO SAY:**

*“We already know it won't work at first. We're interested in seeing what doesn't go as planned, so we can learn what we need to work on.”*

*“Don't be discouraged when an experiment fails. That's how we learn!”*

# THE BASIC PATTERN

## For using the PDCA Cycles Record

PDCA CYCLES RECORD <i>(Each row = one experiment)</i>					
Obstacle:		Process:			
		Learner:		Coach:	
Date, step & metric	What do you expect?			What happened	What we learned
		<div style="writing-mode: vertical-rl; transform: rotate(180deg);"> Do a Coaching Cycle  Conduct the Experiment </div>			

- (1) Plan the next experiment (& then conduct a Coaching Cycle)
- (2) Reflect on the outcome of the experiment by comparing the prediction with the actual results
- (3) Plan the next experiment based on what you learned

# STEPS FOR USING THE PDCA CYCLES RECORD

The PDCA Cycles Record is read left-to-right, one row at a time.  
Each row = one experiment. Once you get started, the pattern of the form repeats after each experiment.

① **PREDICTION SIDE:**  
*Before the first coaching cycle the Learner proposes the 1st step, what will be measured, and what s/he expects in the first two boxes of the form*

## THRESHOLD OF KNOWLEDGE:

- What do we need to learn now?
- How will we test it?
- How will we measure it?"

PDCA CYCLES RECORD (Each row = one experiment)			
Obstacle:		Process:	
		Learner:	Coach:
Date, step & metric:	What do you expect?	What happened	What we learned
X	X	Do a Coaching Cycle Conduct the Experiment	

Now the Learner and Coach  
do a coaching cycle

Then the Learner  
conducts the experiment

# STEPS FOR USING THE PDCA CYCLES RECORD

PDCA CYCLES RECORD <small>(Each row = one experiment)</small>			
Obstacle:		Process:	
		Learner:	Coach:
Date, step & metric	What do you expect?	What happened	What we learned
		X	X

① **PREDICTION SIDE:**  
*Before the first coaching cycle the Learner proposes the 1st step, what will be measured, and what s/he expects in the first two boxes*

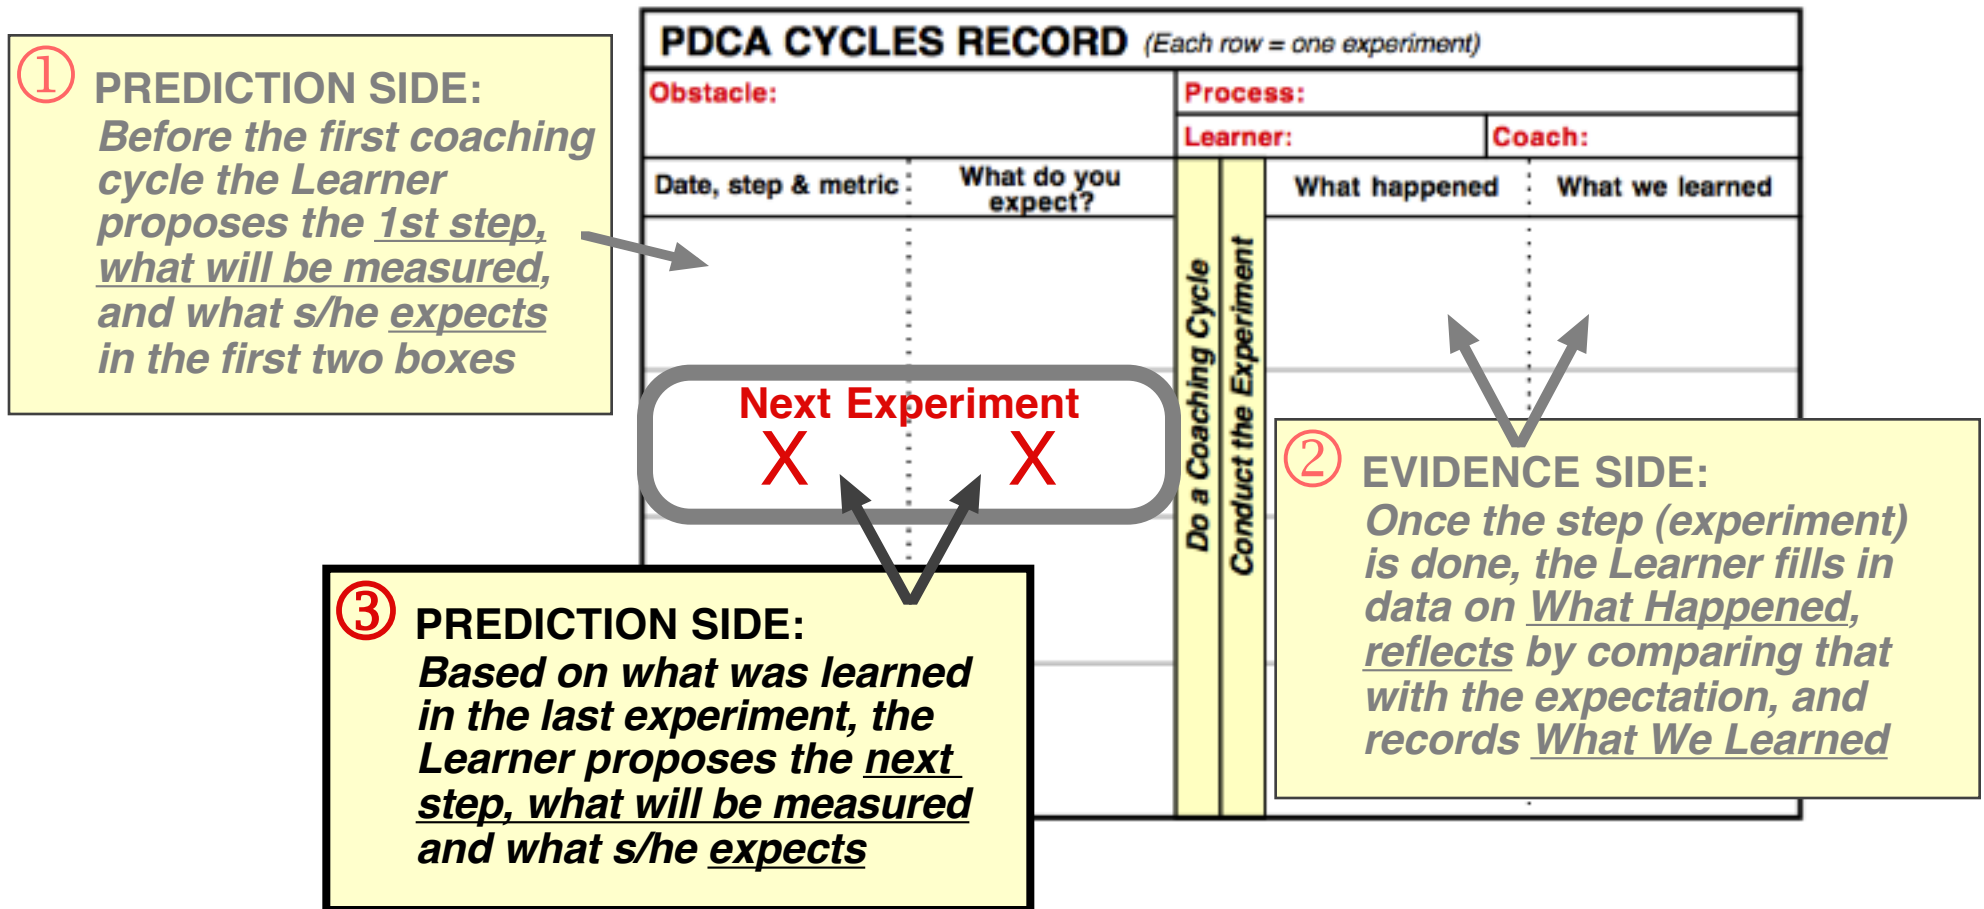

② **EVIDENCE SIDE:**  
*Once the step (experiment) is done, the Learner fills in data on What Happened, reflects by comparing that with the expectation, and records What We Learned*

Reflect on the data, observations and even how you took the step. What went differently than you expected?

In checking the results of an experiment try to measure and observe several cycles of the process.

# STEPS FOR USING THE PDCA CYCLES RECORD

Now it's time for the next coaching cycle

# THE SCIENTIFIC LEARNING CYCLE IS EMBEDDED IN THE PDCA CYCLES RECORD

To make the cycle easy to operationalize & practice

**ACTION**

PDCA CYCLES RECORD <small>(Each row = one experiment)</small>			
Obstacle:		Process:	
		Learner:	Coach:
Date, step & metric	What do you expect?	What happened	What we learned
PREDICTION		EVIDENCE	EVALUATE

*Do a Coaching Cycle*  
*Conduct the Experiment*

# EXPERIMENT GUIDELINES FOR THE LEARNER

**INCLUDES CHECKLISTS FOR  
PLANNING & EVALUATING  
YOUR EXPERIMENT**

**Print out and use the checklists**

# CHECKLIST FOR **PLANNING** A GOOD EXPERIMENT

## Evidence of scientific thinking

- ☐ Conduct the next experiment at your current threshold of knowledge.  
What is the current TOK? \_\_\_\_\_  
What do you need to learn now? How will you test it?  
How will you measure it?"
- ☐ Conduct your experiment against the current obstacle.
- ☐ Can you do a single-factor experiment, where only one thing is changed?  
(Not always possible)
- ☐ How can you test your prediction as soon and quickly as possible?  
Simple & soon is better. How about now? (*Hold* before *tape* before *weld*)
- ☐ Make sure that failure won't harm anyone or anything. If necessary  
build up a buffer before conducting the experiment.
- ☐ The experiment must be measureable, so you can see if the prediction  
was correct or not.
- ☐ Write on the PDCA Cycles Record what you expect to happen  
(your prediction) before you do the experiment.
- ☐ If possible the experiment should build on what was learned in  
your previous experiment.

# THE STEPS YOU TAKE DON'T COME FROM AN ACTION-ITEM LIST

A chain of  
PDCA cycles

**VERSUS**

A preconceived  
action-item list

Most of the day-to-day steps you take toward the target condition won't come from a pre-determined action plan, Pareto analysis or brainstorming. They come from the chain of rapid and frequent PDCA cycles, where what you learn in one step often leads you to your next step.

**Do not stab at an obstacle with disconnected countermeasures in the hope that something will work. Instead, this is how you iteratively work toward and find your way to the target condition by the achieve-by date:**

- (1) Only work on those obstacles that you sequentially find are actually preventing you from reaching the target condition.
- (2) Try to work on one obstacle at a time. Plan your steps and reflect on them with the PDCA Cycles Record.
- (3) From each experiment related to the current obstacle you'll gain new information. Use this information to adjust and define your next step toward breaking through the obstacle. Then choose the next obstacle.
- (4) Keep in mind that the target condition's achieve-by date is firm. Do your experiments as fast and frequently as possible.

# DO YOUR PDCA<sub>s</sub> AT *KNOWLEDGE THRESHOLDS*

Create new learning where the facts run out

This is where you should do  
your next PDCA experiment

Predictable Zone

Uncertainty / Learning Zone

Experimenting

Current  
Knowledge  
Threshold

Spot the knowledge threshold,  
acknowledge it, and conduct  
your next PDCA experiment  
here as quickly as possible!

# THE NEED TO TEST

**Use whatever information and knowledge you can in order to design your experiments toward the target condition. This includes existing information such as research results.**

**However, keep in mind that even if you reference existing information, what will end up working for your specific case and target condition is still a grey area where you need to iterate. The information you use, regardless of its source, needs to be tested and verified within the context of your current and target conditions.**

# IF POSSIBLE DO SINGLE-FACTOR EXPERIMENTS

Also called “Controlled Comparison”

Try to change only one thing at a time and then check the result against the expected result. Such “single-factor experiments” are preferred because they allow you to see and understand cause and effect, which helps you develop a deeper understanding of the process you’re trying to improve. The goal is to learn about the focus process, not just to shut off a problem via a shotgun blast of countermeasures.

Of course, serial rather than parallel countermeasures would be too slow if each PDCA cycle takes a long time. This is another reason why individual PDCA cycles should be turned as quickly as possible.

Single-factor experiments are not the only kind of experiment and not always possible. The table on the next page describes three common types of PDCA experiments.

# EACH STEP YOU TAKE = A PDCA CYCLE

A PDCA cycle may take only minutes. Suppose we decide, in pursuit of a target condition, to move some work elements from one operator to another.

We take that step, observe that the outcome is not what we expected, but then recognize something else that could generate the desired effect. That was a PDCA cycle.

# When you experiment...

## YOU DON'T HAVE TO THINK TOO FAR AHEAD

You don't actually know what the result of the next step will be

Once you have a target condition, concentrate on the next step. What you learn from that will probably influence your next step after that, so be in the moment and apply PDCA.

You'll only see the full path to the target condition in *hindsight*. You're probably not going to be taking the most direct route there.

# DO YOUR EXPERIMENTS INSIDE THE **PDCA ZONE**

The Target Condition is measurable and has a hard achieve-by date. There are budget constraints and quality & safety parameters. There's a disciplined, standardized process for carrying out the experiments.

It's *within* these boundary conditions that you and your team design and conduct frequent, rapid, cheap, non-harmful, successive experiments toward the target condition. Experiments are done as cheaply and quickly as possible. For example, think *hold* before *tape* before *weld*.

It's important that there is no penalty for failures inside the PDCA Zone. On the contrary... failed experiments is how we learn!

# TRY TO DO THE EXPERIMENT RIGHT NOW, WITH WHATEVER YOU HAVE

Conduct your experiment as quickly and cheaply  
as possible by asking, *can we do it right now?*

The results of experiments are what help you see beyond the current knowledge threshold, uncover true obstacles and find the way forward. You'll see the next step and maybe the next obstacle after taking a step, so take that step ASAP.

# EXAMPLE OF 3 KINDS OF PDCA EXPERIMENTS

An *experiment* is a learning experience that doesn't necessarily involve making a change in the focus process. "Further analysis" or "go and see" can be an experiment, as long as a prediction of "what the Learner expects" is made on the PDCA Cycles Record. The following hierarchy goes from less to more scientific. All are acceptable.

## 1) Go and See

Direct observation and data collection, without changing anything, to learn more about a process or situation.

## 2) Exploratory Experiment

Introducing a change in a process to see, via direct observation, how the process reacts. Done to help better understand the process.

Example: Try to run a process as specified in the target condition in order to see what happens. This is often an early experiment.

## 3) Testing a Hypothesis

Introducing a change, ideally in only a single factor, together with a prediction of what you expect to happen.

# WHAT SHOULD YOUR FIRST STEP BE?

The first experiment is often an exploratory experiment

One elegant tactic for a first step is to try to run the process as described in the target condition. We already know it won't work, but you are at a knowledge threshold right now. That is, you may only have conjecture about what first step to take. An exploratory experiment like this gets *true* obstacles to reveal themselves, so you know *scientifically* what you *need* to work on.

# CHECKLIST FOR **EVALUATING** THE RESULTS OF AN EXPERIMENT

- ☐ To check the results of an experiment you may need to observe and measure several cycles.
- ☐ Evaluation has two phases:
  - 1) Compiling the facts and data from the experiment (“Check”)
  - 2) Forming conclusions based on the facts and data. (“Act”)Maintain a clear distinction between recording the facts / data, and interpreting the results.
- ☐ There are several possible outcomes, for instance:
  - > The results support your prediction and you can standardize the step.
  - > The results do not support your prediction. (Interesting!)
  - > The results came close and you can see what you have to try next.
  - > You can't tell and need more information.
- ☐ It is not unusual for more than 50% of the experiments to fail. The benefit you get is learning from them what you *need* to focus on and do to overcome the obstacle.
- ☐ When an experiment is successful you may need to think about how to standardize the change you made.
- ☐ It's a good idea to reflect on what could you have done differently to improve your experimental procedure.

# PREPARING FOR A COACHING CYCLE AFTER EACH EXPERIMENT

## Instructions for the Learner

1. Record data about what actually happened **(B)**.
2. Compare the prediction you recorded before the experiment **(A)** and the data from the experiment **(B)**. Summarize what you learn **(C)**.
3. Taking all of that in, decide what you propose for the next step (the next experiment), and what you expect **(D)**. Use the Planning Checklist to help you design a good experiment.

PDCA CYCLES RECORD <small>(Each row = one experiment)</small>					
Obstacle:		Process:			
		Learner:		Coach:	
Date, step & metric	What do you expect?	What happened		What we learned	
<b>A</b>		<b>B</b>		<b>C</b>	
<b>D</b>					

*Prediction Side*

*Evidence Side*

The information on the PDCA Cycles Record is written by the Learner before the next coaching cycle. During the coaching cycle the Coach will either accept the proposed next step (next experiment), or give feedback to help improve the design of the next experiment.

# NOW UPDATE YOUR STORYBOARD

The current condition may be new after each experiment

Focus Process:		Challenge:
Target Condition Achieve by: _____	Current Condition	PDCA Cycles Record
		Obstacles Parking Lot

Any time you make a change in a process, it's now a new process that has a new current condition.

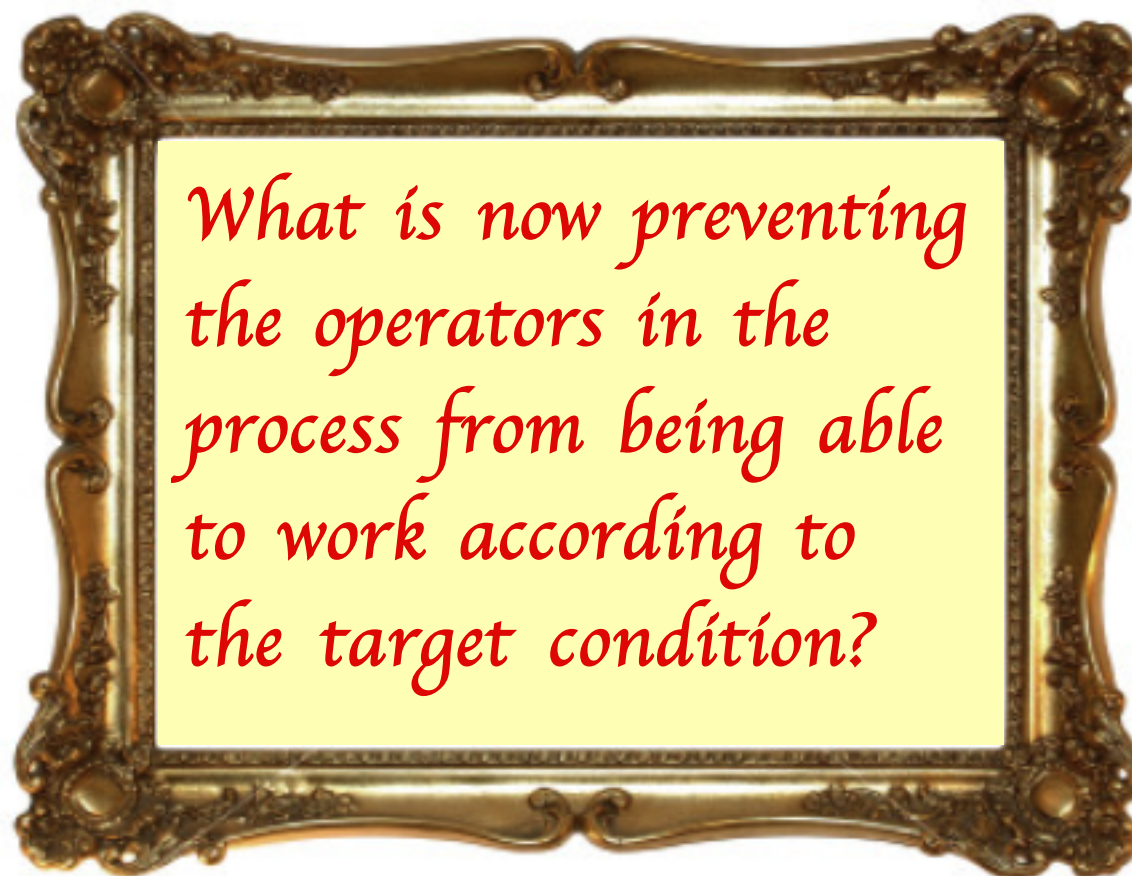

- Update the facts and data in the **“Current Condition”** field of your storyboard before the next coaching cycle.
- Also update the **“Obstacles Parking Lot,”** if new obstacles were discovered or listed obstacles are no longer an issue.
- You can also add detail to the **“Target Condition”** as you learn.

# COACHING CYCLE: Answering the Coach's Questions

<b>0</b>	<b>What is the challenge?</b>	Explain what you understand the overarching challenge to be, which comes from the level above you.
<b>1</b>	<b>What is the target condition?</b>	Read through the description of the target condition that's posted on your storyboard. Point to the items as you read. The TC should be measureable and have an achieve-by date.
<b>2</b>	<b>What is the actual condition now?</b>	Read through the facts, data and diagrams of the current condition as it is now (not the initial current condition) that's posted on your storyboard. Point as you read.
<b>REFLECTION</b>	<b>What was your last step?</b>	Read the first box on your PDCA Cycles Record.
	<b>What did you expect?</b>	Read the second box on your PDCA Cycles Record.
	<b>What actually happened?</b>	Read the third box on your PDCA Cycles Record.
	<b>What did you learn?</b>	Read the fourth box on your PDCA Cycles Record.
<b>3</b>	<b>What obstacles do you think are preventing you from reaching the target condition? Which <i>*one*</i> are you addressing now?</b>	Read through the items on your Obstacles Parking Lot.  Stick an arrow pointing at the obstacle you are currently working on, and point to this obstacle.
<b>4</b>	<b>What is your next step? (next PDCA experiment) What do you expect?</b>	Read the first and second boxes in the <u>next row</u> of your PDCA cycles record. <b>Use the “<i>Checklist for Planning PDCA Cycles</i>” to help you plan and explain your next experiment.</b>
<b>5</b>	<b>When can we go and see what we have learned from taking that step?</b>	Date and time you propose for the next coaching cycle. The Coach will encourage you to do the experiment as soon as possible. Agree on the facts & data you'll bring to the next coaching cycle.

**If possible *show* your Coach at the focus process what you're talking about**

## ASK YOURSELF THIS QUESTION AFTER EACH EXPERIMENT

**This perspective will keep you focused on the work process  
and help you work together with the process team**

# GET USED TO BEING IN THE *LEARNING ZONE*

It's where improvement, adaptiveness  
and innovation happen

**Don't give up on the target condition!** The failures and obstacles you encounter are not reasons to abandon the target condition. They are the things you have to figure out and work through.

# WHEN YOU REACH THE ACHIEVE-BY DATE

At some point you'll reach the target condition achieve-by date, often, but not always, having achieved your target condition. At this point you should pause and:

- Do a summary reflection, i.e. a major reflection over the entire process. This can lead to lots of learning that may be applied in the next cycle through the Improvement Kata pattern.

Then:

- Revisit the overall direction or challenge
- Grasp the current condition as it stands now
- Establish the next target condition

**Remember, you'll most likely move through several target conditions in order to achieve the challenge**

## **Special Cases: WHAT ABOUT EXPERIMENTING WITH LONG-CYCLE PROCESSES?**

**The time it takes to conduct an experiment is often related to the cycle time of the focus process you're working on. The longer the process cycle, the longer the PDCA cycle, especially since you ideally need more than one data point. This can slow your learning, since you can't see further (beyond the knowledge threshold) without actually trying your next idea in some way.**

**Processes with very long cycles or that operate infrequently...**

- May not be available very often, making it difficult to observe the process.**
- May mean that running an experiment can take days.**
- Make it difficult to do single-factor experiments, because when the rare chance to test arises the Learner may naturally want to test several factors at once.**

# EXPERIMENTING WITH LONG-CYCLE PROCESSES

**When you're faced with a difficult process the question is not whether you *should* experiment, but *how***

**How do you accelerate testing in infrequent processes with extended cycle time -- like some administrative and chemical processes -- to gain knowledge in a rapid, low cost way?**

**In these cases experiments often involve some type of parallel 'laboratory' simulation. The question becomes, “*How can we artificially test this step or idea more quickly?*” This approach involves conducting a series of rapid, low-cost simulation experiments (one per day for instance) in between less-frequent experiments on the actual process. You gain several learnings in the interval between actual process cycles, which culminate in one "big" experiment at the actual process under real conditions, to get information that can only come from the real process.**

# WHAT IF AN EXPERIMENT TAKES A LONG TIME TO PREPARE?

You can work in parallel when one step will take a long time to prepare. However, you should still try to change only one thing at a time in the focus process, to help you understand cause-and-effect.

Here's a way to work in parallel in this situation.

(X = a step/experiment)
